

Environmental conservation guideline

. Basic philosophy

As our corporate philosophy, we will aim to become a corporation which contributes to the society through development of superior products and services based on “MONOZUKURI (the art of manufacturing) and technical innovation”.

As our environmental philosophy, we will contribute to the environment conservation by fully recognizing that corporate activities are closely related to the global environment, and we will plan for harmonization with the environment in our corporate activities.

. Environment policy

- 1) Giving consideration to the impact of business activities to the environment, we will address the issue of environment conservation in a positive manner.
- 2) We will promote engineering development and product development giving considerations to the impact to the environment.
- 3) We will establish our voluntary control criteria as well as complying with the environment related laws and regulations, thus address the issue of environment conservation.
- 4) We will announce our environment policy externally as well as informing to all the employees.

. Organization (management organization)

We will make sure that our environment policy is known to all the officers and employees of the company, and we will review and decide the environment policy, targets and plans through “environment promotion project” in order to execute environment load reduction activities.

. Environment load reduction activities

- 1) Reduction of electric power consumption
We are promoting reduction of unnecessary electric power consumption for prevention of global warming and prevention of natural resource depletion such as oil.
- 2) Reduction of paper consumption
We are promoting reduction of copy paper consumption for prevention of global

warming and protection of forest resources.

3) Improvement of waste recycling ratio

Categorization of waste is indispensable for recycling. We have prepared a place in our facility so that anybody can easily and correctly categorize the waste, thus promoting a thorough segregation.

4) Our effort in development and design

We are promoting and continuously tackling with the reduction of environmental load from the development and design stage of technology, product and service.

We are making efforts for the utilization of parts and material superior in terms of energy saving and resource saving and for reduction of the number of parts and material used, thus tackling with the reduction of environmental load and prevention of environmental contamination.

We are tackling with the development and design of environment conforming products and services which are compliant to environment related laws/regulations and requirements.

- * We were successful in the development of a rotary squeegee (sealed type squeegee) for Pb free solder paste, and we were able to productize it ahead of our competitors. Furthermore, we are working on the development of LED manufacturing equipment. We will continue to offer products giving considerations to environment conservation toward the future.

5) Our efforts in green procurement

We are promoting the procurement of components with less environment load based on the “Green Procurement Guideline” to decrease environment load in the overall corporate activities.
